PREFACE

In today's increasingly complex world, reliable and detailed information is an indispensable part of making the right decision. This is especially true with regard to information at the regional and local levels. For almost two decades, the National Planning Association has published an annual series of Regional Economic Projections, which is available to members of NPA and to the general public on a subscription basis. The series provides detailed data on economic and demographic trends for regions, states and metropolitan areas of the United States. During the past year, these regional projections have been substantially refined and extended, with the introduction of comprehensive projections at the county level.

NPA has drawn on the in-depth information already developed for its Regional Economic Projections Series in offering this collection of economic maps to the general public. The maps in this volume are intended to provide basic information on the regional growth of population, employment and income by state, and, in greater detail, by 183 "economic areas" as defined by the Bureau of Economic Analysis, U.S. Department of Commerce. It also contains, for the same geographic units, descriptions of the age, sex and race characteristics of population, composition of employment by industrial sector, and an analysis of income in terms of wages and salaries, property income and transfer payments.

These maps and the tabulations of data accompanying them represent a unique and useful base of information for decision makers, planners, analysts, and educators.

This book was prepared by the staff of the NPA Center for Economic Projections under the direction of Nestor E. Terleckyj, NPA Vice President. Timothy B. Sivia designed the map and table formats and the computer programs for their preparation.

Arthur J.R. Smith
President, National Planning Association
Washington, D.C., December 1979

The maps in this volume illustrate the basic structural characteristics of the American economy and major geographic changes over time in population, employment and income. They include historical data for the 1967-79 period and projected changes for the 1979-90 period. Structural characteristics are analyzed for the year 1979.

Part I of this book details economic and demographic developments at the state level. In Part II, this information is charted for "economic areas," comprising smaller and more self-contained economic entities which have been identified by the Bureau of Economic Analysis of the Department of Commerce. Within each Part, the maps are grouped under four subjects: growth summaries, population characteristics, employment composition, and income by source. The data used to draw each map are presented in tabular form on the opposite page.

Historical Data, Estimates and Projections. The 1967 data are actual historical figures. The 1990 data are NPA projections. The data for 1979 are NPA estimates based on long-term growth paths of the relevant variable. These estimates are made by interpolating between the values projected to 1990 and the latest historical data available for 1975 and 1976.

Projection Methodology. The 1990 regional projections are based on the national projections developed in NPA's National Economic Projections Series. The particular national projection reflected in this volume is characterized by a long-term rate of economic growth in real GNP of 3.7 percent a year. It reflects a relative shift of resources from the government to the private economy, a 2.1 percent annual growth in hours worked in the private economy, a 4.5 percent rate of growth in real net capital stock, and a 2.0 percent rate of productivity growth.

Population is projected in detail by age, sex and race, employment by type, and income by type. The projected national totals are distributed geographically by the NPA regional projections model which utilizes a system of 100,000 "share equations." This is accomplished in two stages. First, the national totals are allocated among the 183 BEA economic areas; then, the area totals are distributed among the 3,098 individual counties. The share equations are estimated econometrically with the data for the period 1967-75. They reflect concurrent and lagged relationships between income, population and employment, as well as other variables. Additional techniques are employed to ensure that the independently projected shares conform to their totals and to prevent the projections for a particular item from exceeding certain limits consistent with previous experience in the rate of change for that item at that level of geographic detail. All the projected series are calculated annually for the years from 1976 to 1990 using the latest summary control totals for 1976. The 1979 estimates and the 1990 projections mapped in this volume are obtained from these series.

Identifying States and Economic Areas on the Maps. Because of their limited size, the maps do not list the names of the states and "numbers" of the economic areas. To help identify states and economic areas on the maps, two overlays are provided in the pocket preceding the back cover which can be placed directly over the maps. The overlay for the states shows the boundaries and name of each state. The second overlay outlines the boundaries and identifying number of each economic area. A description of the purpose and methods by which these areas are defined is on page 285, followed by the listing of economic areas both by their identifying number and name of principal city.

Data Sources and Definitions: Population. The total population estimates included in the economic data base are residence-based estimates as of July 1 for each year. The income tapes from BEA's Regional Economic Measurement Division contained annual county total population estimates for 1967 through 1975. These estimates were updated with data published in Current Population Reports, Series P-25 and P-26, of the Bureau of the Census.

The population estimates in the demographic data base, including population by age, sex and race, were developed from tapes obtained from the USDA-UGA Internal Migration Studies, Institute for Behavioral Research, University of Georgia, Athens, Georgia.

Employment. The employment data include estimates of full and part-time wage and salary employees plus the number of proprietors in unincorporated businesses. The source for these estimates (1967 through 1975) is BEA's Regional Economic Measurement Division. BEA has compiled estimates from various government sources, relying primarily on administrative records of State Employment Security Agencies which account for about 75 percent of BEA's employment estimates. The remaining BEA employment estimates were derived from the Old-Age and Survivors Insurance (OASI) program, various censuses and professional organizations. Concerted efforts were made to cover all industries and all types of employment.

Income. The income data include personal income by source, and employee and proprietors' earnings by broad industry groups. The source for these estimates from 1967 through 1975 is BEA's Regional Economic Measurement Division. Personal income is described as current pretax income accruing to residents of an area, net of personal contributions to social insurance programs. It includes wage and salary disbursements; other labor income including employer contributions to private pensions and welfare funds, and directors' fees; proprietors' income; dividends, interest and rent; and government and business transfer payments.

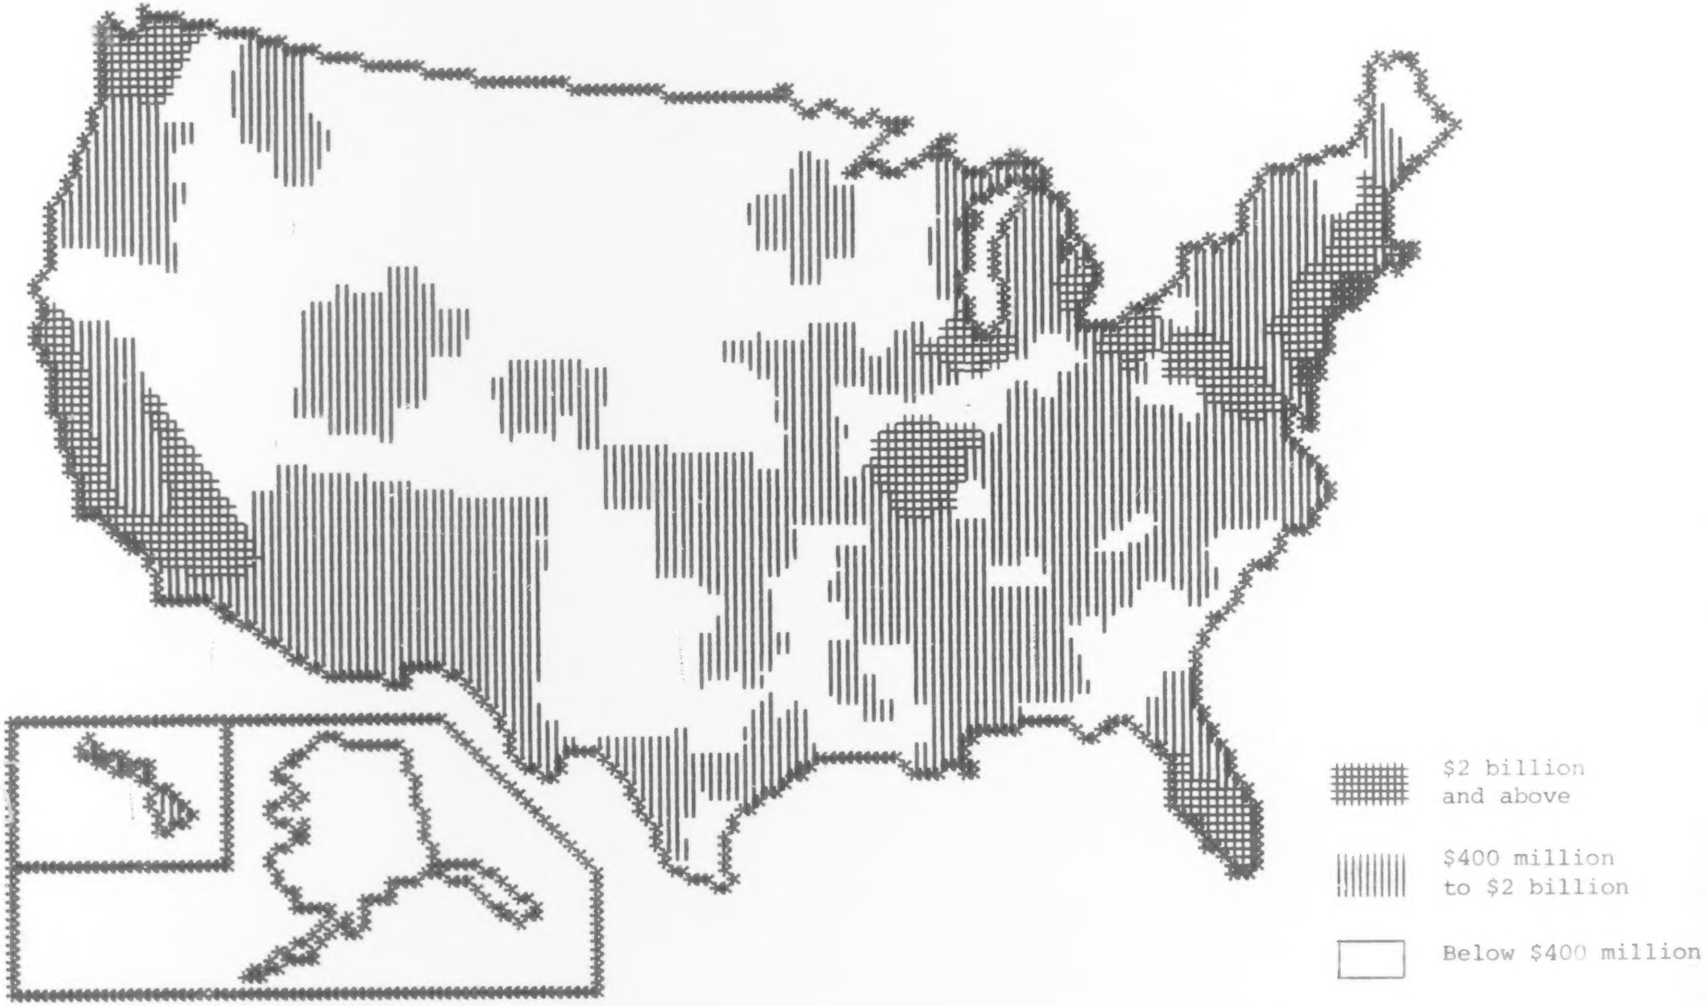
TRANSFER INCOME BY ECONOMIC AREA, 1979



$2 billion and above
$400 million to $2 billion
Below $400 million

BEA ECONOMIC AREAS*

The Bureau of Economic Analysis (BEA) economic areas are functional areas delineated to facilitate regional economic analysis. Each area consists of an economic node--a standard metropolitan statistical area (SMSA), or similar area, that serves as a center of economic activity--and the surrounding counties that are economically related to the center. To the extent possible, each area includes the place of work and place of residence of its labor force. The areas cover the entire United States.

Currently (1977 revision), there are 183 economic areas. Their delineation is based primarily on three sets of data: (1) journey-to-work data from the 1970 Census of Population; (2) newspaper circulation data for 1972; and (3) 1975 county commuting data developed from Social Security Administration and Internal Revenue Service records.

As a first step in defining the BEA economic areas, the SMSA containing the largest percentage of employment in an area identified as a potential economic area was usually chosen as the principal center. In some economic areas, smaller SMSAs were added as secondary centers. Where an SMSA was an integral part of a larger metropolitan complex, a multi-SMSA center was chosen. For example, the Jersey City, Newark, Paterson-Clinton-Passaic, Stamford, Norwalk, Bridgeport, and Nassau-Suffolk SMSAs are all part of the New York City metropolitan area complex, which constitutes the center of the New York economic area. In sections of the country with no SMSAs, cities with population of 25,000, and functioning as economic nodes, were identified as area centers.

After the centers were identified, each of the approximately 2,600 counties that did not fall within a center was examined to determine the center to which it was most closely related. For the bulk of these counties, the primary data source used was journey-to-work information from the 1970 Census of Population. These data showed the gross commuting of workers from each county of residence to as many as 13 counties of work. Counties were assigned to centers in accordance with commuting patterns. In many instances, the association between a county and a particular area was not based on direct commuting ties to the central city or county, but rather on commuting ties to a noncentral county, which, in turn, was tied to the center.

The assignment of counties to centers was more difficult in urban areas of the United States because of the insufficiency of commuting data. This problem was overcome through the use of supplemental data, such as metropolitan newspaper circulation figures in rural areas, and the advice of people, such as state planning agents, who were familiar with the geography and economies of the areas.

The 1970 journey-to-work data were compared with the 1975 county commuting data developed from the Social Security Administration's 10 Percent Continuous Work History Sample and from place-of-residence data from Internal Revenue Service records.

The following listing of the economic areas is arranged in accordance with the numerical designations of these areas:

---

NPA is an independent, private, nonprofit, nonpolitical organization that carries on research and policy formulation in the public interest. NPA was founded during the great depression of the 1930s when conflicts among the major economic groups--business, farmers, labor--threatened to paralyze national decision making on the critical issues confronting American society. It was dedicated, in the words of its statement of purpose, to the task "of getting [these] diverse groups to work together ... to narrow areas of controversy and broaden areas of agreement ... [and] to provide on specific problems concrete programs for action planned in the best traditions of a functioning democracy." Such democratic planning, NPA believes, involves the development of effective governmental and private policies and programs not only by official agencies but also through the independent initiative and cooperation of the main private-sector groups concerned. And, to preserve and strengthen American political and economic democracy, the necessary government actions have to be consistent with, and stimulate the support of, a dynamic private sector.

NPA brings together influential and knowledgeable leaders from business, labor, agriculture, and the applied and academic professions to serve on policy committees. These committees identify emerging problems confronting the nation at home and abroad and seek to develop and agree upon policies and programs for coping with them. The research and writing for these committees are provided by NPA's professional staff and, as required, by outside experts.

In addition, NPA's professional staff undertakes research designed to provide data and ideas for policy makers and planners in government and the private sector. These activities include the preparation on a regular basis of economic and demographic projections for the national economy, regions, states, and metropolitan areas; the development of program planning and evaluation techniques; research on national goals and priorities; planning studies for welfare and dependency problems, employment and manpower needs, education, medical care, environmental protection, energy, and other economic and social problems confronting American society; and analyses and forecasts of changing national and international realities and their implications for U.S. policies. In developing its staff capabilities, NPA has increasingly emphasized two related qualifications--the interdisciplinary knowledge required to understand the complex nature of many real-life problems, and the ability to bridge the gap between the theoretical or highly technical research of the universities and other professional institutions and the practical needs of policy makers and planners in government and the private sector.

All NPA reports have been authorized for publication in accordance with procedures laid down by the Board of Trustees. Such action does not imply agreement by NPA Board or committee members with all that is contained therein unless such endorsement is specifically stated.

National and Regional Economic Projections for Decision Making

For the past two decades, the National Planning Association has been providing decision makers with a look at the economic and demographic trends in the years ahead. Currently, the NPA economic projections series capture national developments as well as all important regional trends, down to the county level of detail.

REGIONAL PROJECTIONS

The 1979 Regional Economic Projections Series, which is now available, breaks new ground in low-cost, high-resolution data and projections. This three-volume set summarizes economic and demographic trends at each regional level, presenting historical data from 1967 through 1975, estimates for 1979, and projections, by five-year intervals, from 1980 to 1990.

Subscribers may purchase tapes of NPA's 16 million-cell data base, which includes annual data and projections at the level of regions, states, economic and metropolitan areas, and counties, for the following variables:

- population by 18 age groups by sex and by race (1967-90);
- employment by 21 industry types (1967-90);
- personal income by 26 sources (1967-90).

NATIONAL PROJECTIONS

The 1979 National Economic Projections Series includes new approaches to the dynamics of economic growth:

- labor force participation (Volume One);
- investment, productivity, taxation, and growth (Volume Two);
- prices, inflationary expectations and public policy (Volume Three).

TO SUBSCRIBE

An annual subscription to NPA's national projections service is $750. The cost for the regional projections series is $1,250. A joint subscription is available at a cost of $1,500 per annum. In addition, a tape copy of NPA's data base is available to regional series subscribers at $1,000 for the economic data and $3,000 for the demographic data. To order any of these services, please return the form below.

I would like to subscribe to NPA's National and Regional Economic Projections Series:

☐ National and Regional Series ($1,500/year)
☐ National Series only ($750/year)
☐ Regional Series only ($1,250/year)
☐ Economic data tape, available only to REPS subscribers ($1,000)
☐ Demographic data tape, available only to REPS subscribers ($3,000)

☐ *Please bill*
☐ *Payment enclosed*

Please send me additional information:

☐ *Computer data/projections service*
☐ *Page samples from printed volumes*
